

1. Initial Prompt

Hello! Please help me build a one-page website portfolio with the following: Name, bio, skills, projects, contact. Please add a navigation menu with an About Me, Works, and (Please don't) Contact Me sections. For the About Me section of the page, please add a placeholder name and bio that i'll fill in later. Please also include my skills in that section, which are: Illust, Animation, and Music. For my Works section, please add 2 placeholder images and 1 placeholder gif. The first image is to showcase an example of an illustration, then a gif showcasing an animation, then finally another image showcasing a screenshot of garageband. I'll upload the images and gif later after seeing the format of that section. Finally, in the (Please don't) Contact Me section, please have a header that says (Please don't) in red text and Contact me in black. Please make the color scheme of the website in black, white, and grey and choose a simplistic minimalist style and font.

2. Refinement Prompts (at least 2 more)

Please change the small grey text on each sample to: Illust sample (live2d model), Animation sample, and Music sample

Please change the placeholder name to Kanne.art (which is not a website 🙄🙄) and change the bio to "Too busy watching the latest episode of skibidi toilet and fruit love island" and please change the text under (Please don't) Contact Me to "Reaching out is pointless"

3. Screenshots of Outputs and Website link

ABOUT ME

Kanne.art

Too busy watching the latest episode of skibidi toilet and fruit love island

SKILLS

- Illust
- Animation
- Music

4. Final Reflection:

- What worked well?

Making the website went smoothly, replit was very responsive and worked very well. The generated style is cleaner compared to manually coding in html/css. The overall experience was good because of how fast it works.

- What needed manual fixing?

Although in some parts I asked for placeholder text, the contact me section was specifically changed because it generated a generic sentence without context. I also asked for a black, white, and grey color scheme but it didn't really use grey as much as I wanted. All placeholders like images, texts, and gif were also fixed before publishing.

- What did you learn about prompting?

Prompting is faster than manually coding a website from scratch. Replit makes it easier to work with html and css without worrying about understanding how to code. However, it also made a pretty generic webpage, probably because it based it off of popular website styles. It would take more time to prompt for a unique website if someone really wanted to.
